RESEARCH INTERESTS

High-Performance Computing, System Reliability and Fault Tolerance, Program Analysis, Data Reduction, Reliable and Efficient AI.

SELECTED RESEARCH CONTRIBUTIONS

- **Execution-aware reliability characterization.** Developed execution-aware methods to uncover silent data corruption vulnerabilities across CPU, GPU, and intelligent workloads, enabling reliability evaluation beyond traditional static or average-case testing.
- **Adaptive fault protection and error propagation.** Developed lightweight methods for context-aware fault protection and temporal error-propagation analysis, connecting low-level hardware faults to application-visible outcomes for targeted validation and protection.
- **Data-aware compression and resource management.** Developed models and decision frameworks that use data characteristics and downstream requirements to guide lossy compression, replacing trial-and-error configuration with resource-aware decisions.
